SITE IMPROVEMENTS

PART 1 -GENERAL

DESCRIPTION:

The new asphalt is a replacement of existing asphalt surfaces Bloom Township school sites. Construction includes but is not necessarily limited to grinding or removal of existing asphalt concrete pavement, stockpile of existing aggregate base materials, asphalt surfacing materials, placement of aggregate base and asphalt concrete, seal coat of all asphalt surfaces, crack repair and pavement markings.

QUALITY ASSURANCE:

Qualifications of Workers: Provide at least one person who is thoroughly trained and experienced in the skills required and who shall be completely familiar with the design and application of work required by this section and who shall be present at all times during progress of the work of this section and shall direct all work performed under this section. For actual finishing of asphalt concrete surfaces and operation of the required equipment, use only personnel who are thoroughly trained and experienced in the skills required.

SUBGRADE PREPARATIONS

The area to be paved shall be true to line and grade, having a smooth dry, compacted surface prior to the start of paving operations. The area to be paved shall be free from all loose asphalt and foreign material. All underground utilities should be protected or relocated before grading. All topsoil should be removed. Low-quality soil may be improved by adding granular materials, lime, asphalt, or other mixtures to stabilize the

existing soils. The area to be paved should have all rock, debris, and vegetation removed. The area will be treated with a soil sterilant by the Owner to inhibit future vegetative growth. Grading and compaction of the area should be completed so as to eliminate yielding or pumping of the soil.

The subgrade should be compacted to a uniform density of 95 percent of the maximum density. This should be determined in accordance with Standard or Modified Proctor density (ASTM D698 or ASTM D 1557) as appropriate to the soil type. When finished, the graded subgrade should not deviate from the required grade and cross section by more than one half inch in ten feet. If the subgrade is a fine-grained silt or clay, a separation fabric should be considered for use to prevent the finer material in the subgrade from inundating the more open-graded layers to be placed as a part of the pavement section. The new asphalt is a replacement of existing surface of soil. The Owner or his representative shall inspect the grade through the use of string line, straightedge, levels, or any other means necessary. Upon determining the grade that has been proposed for paving is in conformance with the Specifications, the Owner will provide authorization for the Contractor to proceed with the paving. The Contractor shall not initiate paving prior to receiving authorization to proceed. Construction includes but is not necessarily limited to removal of existing surface, stockpile of existing aggregate base materials, asphalt surfacing materials, placement of asphalt concrete, seal coat of asphalt surfaces and pavement markings.

COMPACTION

Immediately after the asphalt mixture has been spread, struck off and surface irregularities adjusted, it shall be thoroughly and uniformly compacted by rolling. The surface shall be rolled when the mixture is in the proper condition and when the rolling does not cause undue displacement, cracking, or shoving. Initial rolling shall be done with a steel-drum roller with the drive roll operating toward the paver, and/or a suitable pneumatic tired roller. Initial rolling shall be completed while the bituminous mat temperature is above two hundred twenty-five degrees (225°) Fahrenheit. Following the initial rolling at least three coverages of the pavement shall be completed with a pneumatic tired roller, while the mat temperature is above one hundred seventy-five degrees (175°) Fahrenheit.

Final rolling shall be completed with a steel-drum roller and shall continue until roller marks and further compression are not evident in the pavement and specified density has been achieved. Unless otherwise directed, rolling shall begin at the sides and proceed longitudinally parallel to the road center line, each trip overlapping one-half the roller width, gradually progressing to the crown of the road. When paving in echelon or abutting a previously placed lane, the longitudinal joint should be rolled first followed by the regular rolling procedure. On super elevated curves the rolling shall begin at the low side and progress to the high side by overlapping of longitudinal trips parallel to the centerline. Any displacement occurring as result of the reversing of the direction of a roller, or from other causes, shall be corrected at once by the use of rakes and addition

of fresh mixture when required. Care shall be exercised in rolling not to displace the line and grade of the edges of the asphalt mixture. To prevent adhesion of the mixture to the rollers, the wheels shall be kept properly moistened with water or water mixed with very small quantities of detergent or other approved material. Excess liquid will not be permitted. Along forms, curbs, headers, walls, and other places not accessible to the rollers, the mixture shall be thoroughly compacted with hot hand tampers, smoothing irons, or with mechanical tampers. On depressed areas, a trench roller may be used or cleated compression strips may be used under the roller to transmit compression to the depressed area. Rollers or other vehicles shall not be parked or left standing on pavement that has not cooled sufficiently to prevent indentation by wheels.

WEATHER LIMITATIONS

Asphalt concrete mixture shall not be placed when it is raining or when rain is imminent, on a saturated surface, on an unstable/yielding roadbed, when the base material is frozen, or when weather conditions prevent proper handling or finishing of the mixture. Asphalt concrete mixture shall not be placed unless the surface temperature is forty-five degrees (45°) Fahrenheit or warmer and the ambient air is at least thirty-two degrees (32°) Fahrenheit and not descending. Air temperature shall be measured in the shade away from heat sources at the paving site.

PRODUCT HANDLING

Protection: use all means necessary to protect the material of this section before, during and after installing and to protect the work of other trades.

Replacements: In the event of damage, immediately make all repairs and replacements necessary to the satisfaction of the Owner at no additional cost to the Owner.

SUBMITTALS:

- Certificate of Compliance: Upon completion of all work, submit certificate signed by the material supplier attesting that the material, sources, grading, etc., are as specified.
- Import material for replacement of saturated sub-grade shall be tested by a Geotechnical laboratory to certify that the R-value is 50 or greater. Submit certification to District prior to import of material.

Best Management Practice (BMPs)

- BMPs are scheduling of activities, prohibitions of practices, maintenance procedures and other management practices to prevent or reduce the discharge of pollutants. BMPs also include treatment requirements, operating procedures

and practices to control site runoff, spillage or leaks, sludge or waste disposal or drainage from raw material storage.

- The contractor shall exercise every reasonable precaution and shall conduct and schedule operations so as to protect all storm drain systems, storm water retention/detention basins, irrigation canals or natural streams located within adjacent to or in any way connected with the Project from pollution with mud, silt, fuels, oils bitumen's, calcium chloride, pesticides, herbicides, and any other harmful materials whether emanating from storm runoff or non-storm water discharge.

PART 2 –PRODUCTS

- SEAL COAT:

Pavement shall be sealed with an asphalt-based emulsion with selected mineral fillers and blended binders.

- CRACK SEAL:

Sealant shall be formulated with a balanced blend of 100% polymer, asphalt, plasticizers and inert, reinforcing fillers to produce a hot-pour joint sealant with excellent bonding properties, high resiliency, ductility and resistance to degradation from weathering. It will not become brittle at low temperatures and will not flow or migrate from the joint at temperatures up to 140° F (60° C).
